The first 4-stage, telescopic and compact lifter made entirely in aluminium.

Not only is there a weight reduction but also a saving in the overall dimensions for transportation whilst maintaining all the performance features of steel models. The purpose designed aluminium column extensions run smoothly on Teflon coated guides.

The winch mechanism is designed for loads up to 500kg and lifts the first column by means of a polyester belt providing a smooth and uniform performance;

the additional columns are each lifted by two steel wire ropes. The support legs can be independently adjusted to ensure the Wincher is vertical even on irregular surfaces.

Two wheels assist transportation.

The Wincher series is designed to lift lighting fixtures, speakers, aluminium trusses etc. safely.
